

msgFIT

Our analysis for your successful growth

msgFIT - Our analysis for your successful growth

Analyze your SAP system for the move to SAP S/4HANA

SAP systems are often implemented in long-term projects and are constantly being further developed. What is missing is a sustainable and continuous analysis of the use of the systems. Typical questions in this context are:

- Do you know how your SAP system is used and which transactions users have problems with?
- Do you know which in-house developments are used and have to be migrated to SAP S/4HANA?
- Is your Customizing being exhausted?
- Is your authorization concept secure?
- Are you well positioned when it comes to SAP licensing?
- What is your SAP S/4HANA strategy?
- Do you need key figures to consolidate your migration approach (Greenfield, Brownfield)

msgFIT is a unique automated overall analysis that completely examines the use of the systems by users, authorizations, license allocation and development. Raising these optimization potentials exceeds the costs of the automated short audit many times over. One result can be the generation of process models in SAP Solution Manager, which form the basis for the migration to SAP S/4HANA.

msgFIT - Transformation accelerator for your move to SAP S/4HANA!

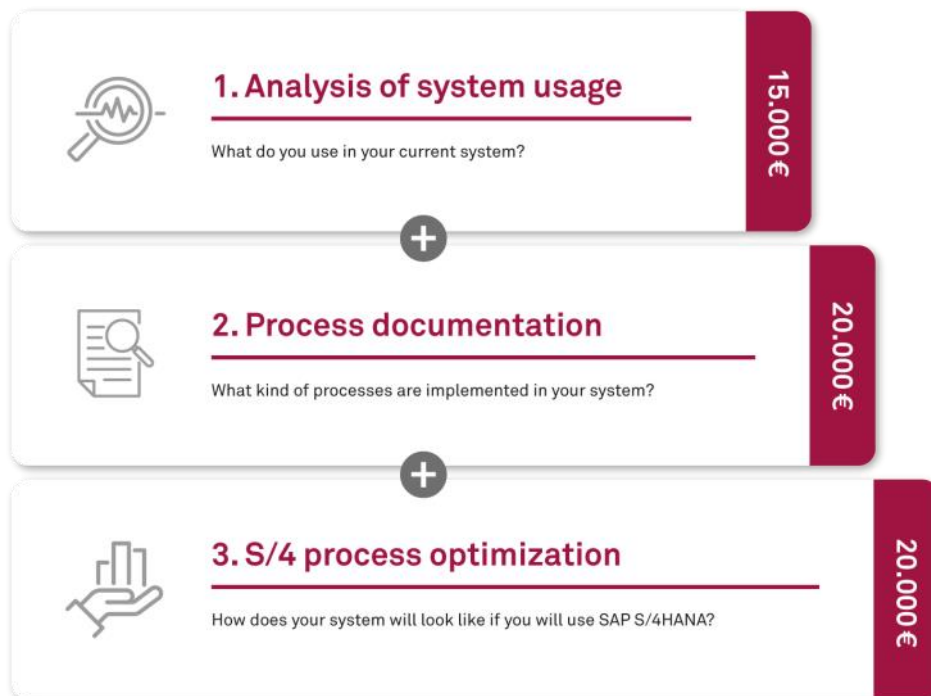

CIO's worldwide are faced with SAP S/4 HANA migrations. Several approaches (greenfield, brownfield and bluefield) are available, but identifying and pursuing the right one has been a lengthy and theoretical exercise for many SAP customers. Knowledge of existing program usage, transaction volumes, customizations, and architecture along with authorizations and key business processes are necessary inputs for a smart transformation, where fitness conditions of the existing ERP systems define the right migration approach. Take advantage of the possibilities that msgFIT offers you and get the basis for a rapid move to SAP S/4HANA.

Key Features

- Automated code remediation: Identify unused developments, processes, programs and customizations.
- Identify security issues and check your SoD's (segregation of duties).
- Compare your license allocation with system usage and authorization.
- Automated plan creation: Generate your process scope based on actual system usage.
- Complete your process scope and re-use it for individual testing scenarios (e.g., Integration testing).
- Enables visualization of your current state ERP system and project scope through Aeneis publisher on AWS.
- Get a production-ready system, where the main processes and process variants are already customized.
- The msg conversion tool allows to transfer customer data from ECC to S/4HANA.
